Addiction is a complex psychiatric condition that can have devastating consequences for both the individual with an addiction and those close to them. Fortunately, there are many effective treatments for addictive disorders and full recovery from these conditions is possible.

Treating Addiction

Drug & alcohol addictive disorders often begin as 'solutions' that are effective at blocking uncomfortable feelings.

Effective addiction treatment first requires healing the source of the pain that the addictive substance or behavior was serving to diminish. Without addressing this underlying problem, it is difficult to attain long-term recovery.

Dual Diagnosis

The term “dual diagnosis” refers to the co-occurrence of an addictive disorder with another psychiatric disorder, such as anxiety disorder, or trauma.

Most recent data suggests that approximately 40% of individuals with a substance use disorder who develop into an addiction typically start off as a solution to a percentage of individuals for whom underlying psychological issues play a role in their addiction. In 100% of all addiction cases.

While “dual diagnosis” was once considered the exception, it is now recognized that the co-occurrence of addictive disorders is the norm. Additionally, there is typically a mutually reinforcing relationship between the two issues, with the addiction worsening the underlying mental health condition and vice versa.
